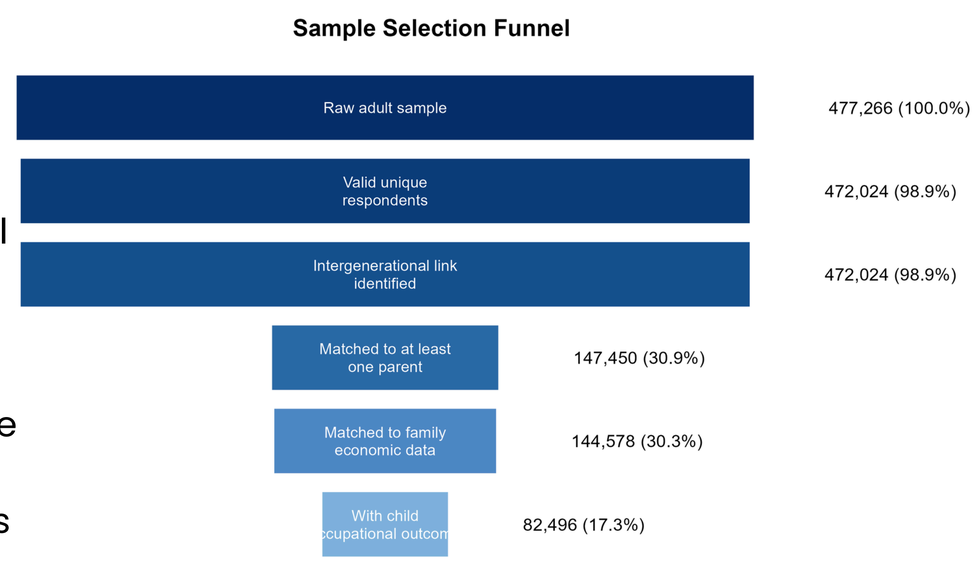
HOW DO PARENTAL SOCIOECONOMIC RESOURCES SHAPE CHILDREN'S OCCUPATIONAL OUTCOMES?

A QUANTILE-BASED ANALYSIS USING CFPS (2010–2022)

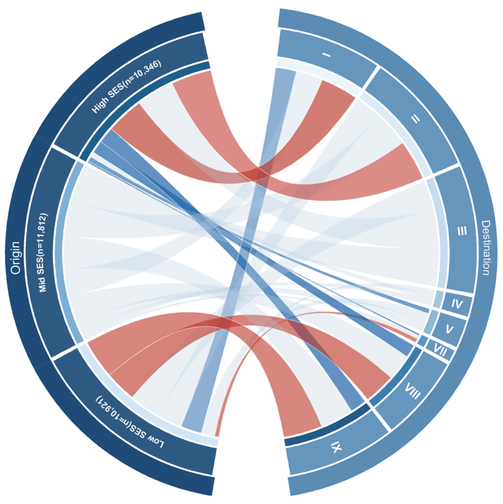
Supervised by Satoshi Araki
Written by Shi Haiyun, Jiang Yunzhi, Yang Yaru and Huang Chao

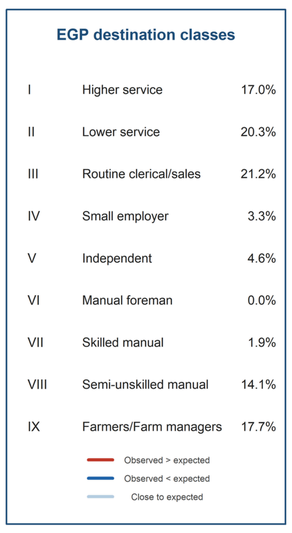
Research Question

- **Do** children from higher socioeconomic status families achieve better occupational outcomes?
- **How** does intergenerational mobility vary across the outcome distribution?
- **What** mechanisms drive the transmission of socioeconomic advantages from parents to children?



Key Finding



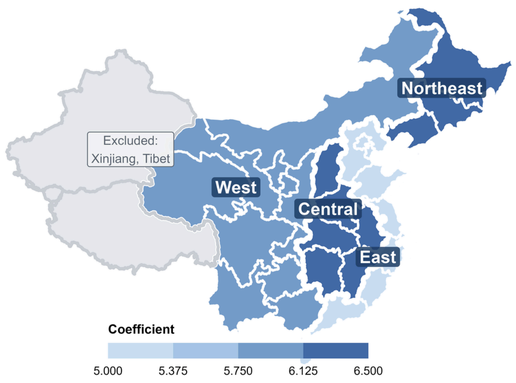


RQ1: Positive Effect

- Parental SES has a strong and statistically significant positive effect on children's occupational status.
- The magnitude of this effect varies across the distribution.

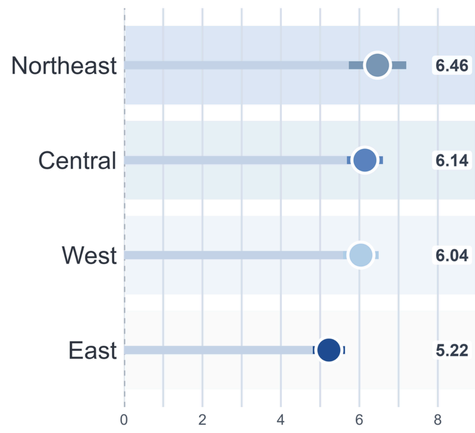
Regional Heterogeneity

Stepped spatial pattern in intergenerational transmission



Estimated Coefficients

Effect of parental SES on child ISEI

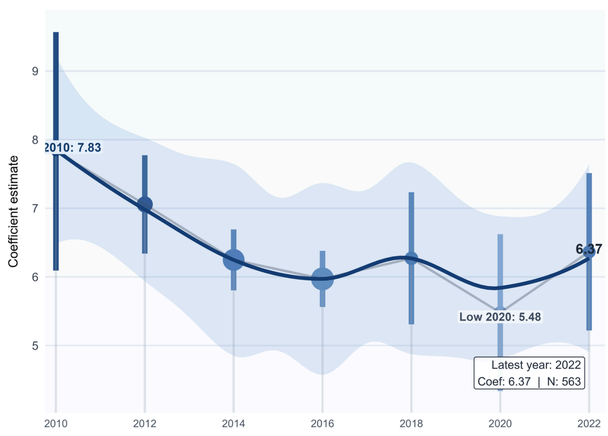


RQ2: Regional Effect

- The effect of parental SES differs across regions.
- More developed regions exhibit stronger intergenerational transmission.

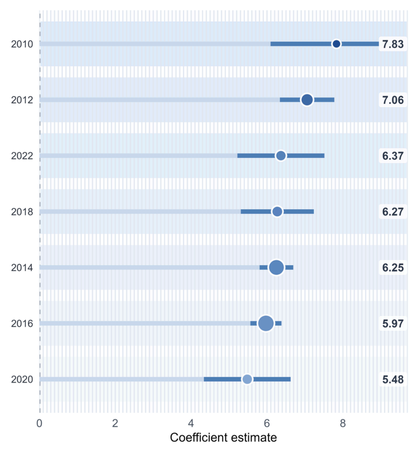
Yearly Dynamics

Smoothed trajectory with yearly CI



Year Ranking Card

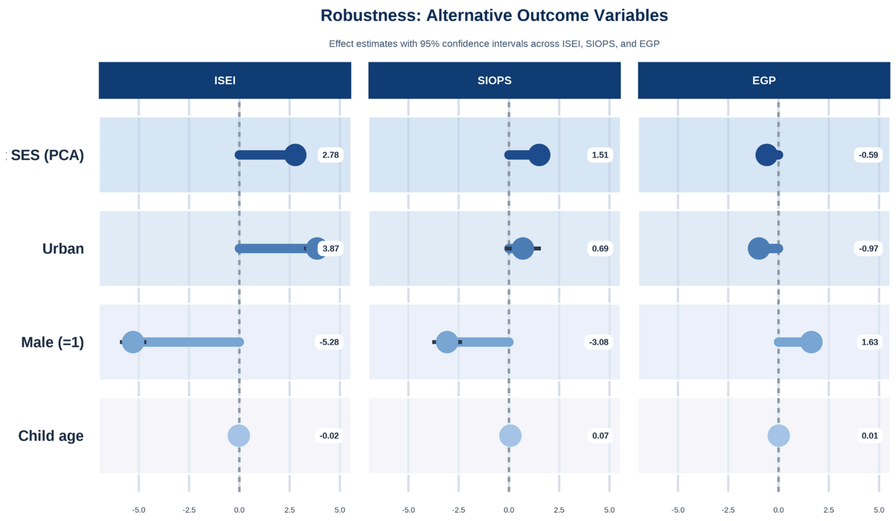
Coefficient size by year



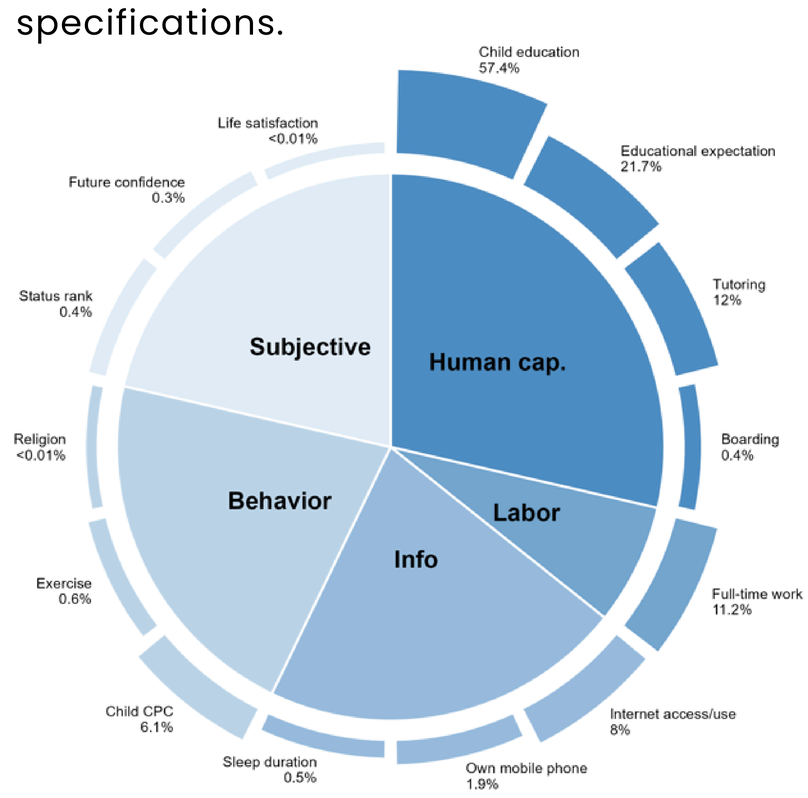
RQ3: Temporal Effect

- The strength of intergenerational association changes over time.
- Period-specific fluctuations may reflect institutional and economic transitions.

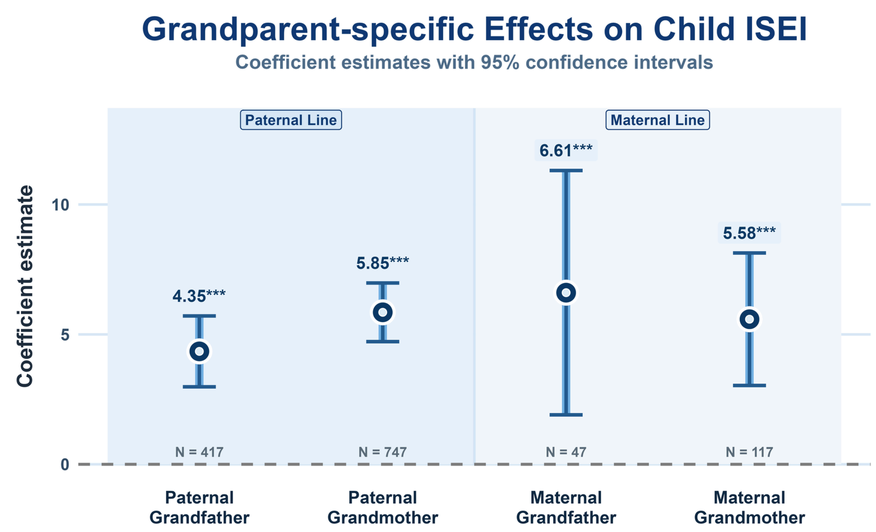
Mechanism



- **Robustness:** Results remain consistent across alternative outcome measures and model specifications.



- **Mechanism:** Human Capital Channel, Labor Market Channel, Information Channel, Behavioral & Subjective Factors



- **Further Study:** Grandparental SES also exerts a statistically significant influence on children's occupational outcomes.

Conclusion & Reference

- Occupational advantage is persistently transmitted across generations in China.
